

Leave yourself a way back.

A pocket handoff for unfinished hobbies

You still love the project. You just lost your place.

The half-sewn tote is waiting. You have ten minutes, but the next step is unclear and the materials have moved. Unpause helps preserve the context before you stop, so you can return ready to make.

THE COMPLETE RETURN LOOP

- 01 Pause with context**
Save a photo, a stopping point, one small next action, and where the materials live.
- 02 Find a project that fits**
Choose 10, 25, or 45 minutes and your energy. See matching projects, with blocked work clearly identified.
- 03 Make, then leave a handoff**
Start an optional session. Save what changed, keep the history, and finish a project when it feels finished.

WHY THIS PROBLEM

Makers already describe losing their construction plans after a pause and leaving next-step notes with stored projects. [1] That is qualitative evidence of the behavior, not a market-size estimate or proof that people will pay.

A focused utility. An honest launch plan.

FREE TO START. STUDIO ONCE.

Free: three unfinished projects, with completed projects, session history, reminders, and user-controlled backups. **Studio:** a proposed US \$19.99 lifetime purchase for unlimited unfinished projects, subject to technical storage limits. Actual checkout uses the localized store price.

1,000 purchases would produce **\$19,990 in gross sales** before fees, refunds, taxes, support, and infrastructure. This is illustrative arithmetic, not a forecast, profit, or recurring revenue. Local storage avoids per-session inference costs.

A REAL COMPETITIVE LANDSCAPE

Krafio and Purlsy organize craft projects and progress. Tapcord connects physical craft items to their history. [2–4] Unpause bets on a short return ritual organized around available time and the next physical action. No durable moat or unique-invention claim is established.

IMPLEMENTATION AND RELEASE GATES

Repository implementation: Expo/React Native, local project handoffs, session history, validated backup import, and RevenueCat lifetime integration. Optional Supabase identity does not synchronize project data.

Before public launch: configure seller accounts and store products, verify real purchases on a Galaxy device, sign and submit the binary, pass store review, and record the final device demo. A source build or preview does not meet the public-release requirement. [5]

Next validation: observe makers returning to their own projects, compare with Notes, and test actual Studio purchases. No customer traction, measured time savings, or revenue is claimed.
